EDUCATION

Quinnipiac University — Hamden, CT B.S. Computer Science | Minors: Game Design, Mathematics | GPA: 3.76/4.0

WORK EXPERIENCE

Pensar | *Software Engineer Intern* | New York, NY **June 2025 – September 2025**

- Built an internal GitHub scraper using Python, FastAPI, and the GitHub REST API to collect structured data across ~20,000 open-source repositories, and developed full-stack internal tooling using Vercel, Netlify, Render, and Supabase — reducing manual repository analysis effort and accelerating the founder's research workflows.
- Conducted research on leading AI code-generation tools (Claude, Cursor, Copilot), identifying and documenting exploitable attack surfaces to inform Pensar's vulnerability detection capabilities.
- Thrived in a fast-paced startup environment with a small founding team, self-managing across shifting priorities and delivering independently without engineering oversight.

PROJECTS

LLM Code Generation for Semiconductor Simulation [GitHub](#)

- Fine-tuned Qwen, GPT-2, and LLaMA-family models using PyTorch and Hugging Face Transformers with LoRA adapters and RAG pipelines to generate SPICE-compatible Silvaco TCAD simulation code from natural-language device specifications.
- Built data preprocessing pipelines in Python to normalize domain-specific semiconductor syntax, preserving instruction-code pairing fidelity and improving generalization on a hidden evaluation set.
- Constrained model selection to sub-1B parameter architectures, demonstrating that targeted fine-tuning outperforms prompting alone for domain-specific code generation tasks.

Tempo.AI — AI-Powered DJ System (Senior Capstone) [GitHub](#)

- Designed and implemented a Random Forest classifier using Python, Librosa, and Scikit-learn to extract phrase boundaries from user-uploaded songs, enabling the downstream transition AI to make musically coherent decisions.
- Built an end-to-end audio ingestion pipeline that accepted arbitrary uploads, automated feature extraction, and fed structured data to the transition model, expanding compatibility to any user-provided track.
- Resolved critical audio degradation in real-time playback by introducing a buffering layer, making the system demo-ready for capstone presentation; coordinated delivery across a cross-functional team using weekly Agile sprints.

Game Boy Emulator (In Progress) [GitHub](#)

- Developing a cycle-accurate Game Boy emulator in Rust, implementing CPU instruction execution, memory-mapped I/O, interrupt handling, and hardware register emulation to faithfully reproduce original hardware behavior.
- Architected as three independent Rust crates — core emulation library, native desktop frontend, and WebAssembly target — enabling both native and browser-based execution from a single shared codebase.

HONORS & ACHIEVEMENTS

- Placed 2nd Overall — Quinnipiac University Hackathon 2024
- Placed 4th Overall — Quinnipiac University Hackathon 2023
- Dean's List — Spring 2024, Fall 2024, Spring 2025, Fall 2025, Spring 2026

ADDITIONAL EXPERIENCE

Quinnipiac University Hackathon | *Sponsorship Coordinator* | Hamden, CT **Spring 2024 – Spring 2026**

- Secured sponsorships from Unapen, M&T Bank, Travelers, and Garmin by leading targeted outreach efforts, funding event operations and prizes across multiple hackathon cycles.
- Coordinated event logistics and planning with the organizing team, managing schedules, vendor needs, and participant resources.

TECHNICAL SKILLS

Languages: Java, Python, Rust, C, C#, JavaScript, SQL

Frameworks & Libraries: PyTorch, Hugging Face Transformers, Scikit-learn, Librosa, FastAPI, React

Databases & Platforms: PostgreSQL, MongoDB, Supabase, Vercel, Netlify, Render

Concepts: Data Structures & Algorithms, OOP, Agile/Scrum, Git, AI-Assisted Development
